ABOUT US

- TNO-ESI is an open and diverse innovation research centre with strong partnerships with industry-leading high-tech companies

- Capgemini is a leading advisor and transformation partner to companies around the world

- ASML is one of the world's leading manufacturers of chip-making equipment

ABOUT ME – PIËRRE VAN DE LAAR

- Industrial innovator researching evolving product families
- Passionate about architecture, design, and code quality
- Wants to help the young software community to move from green field to brown field development

and academia

RENAISSANCE METHODOLOGY

RENAISSANCE METHODOLOGY

1 Parse

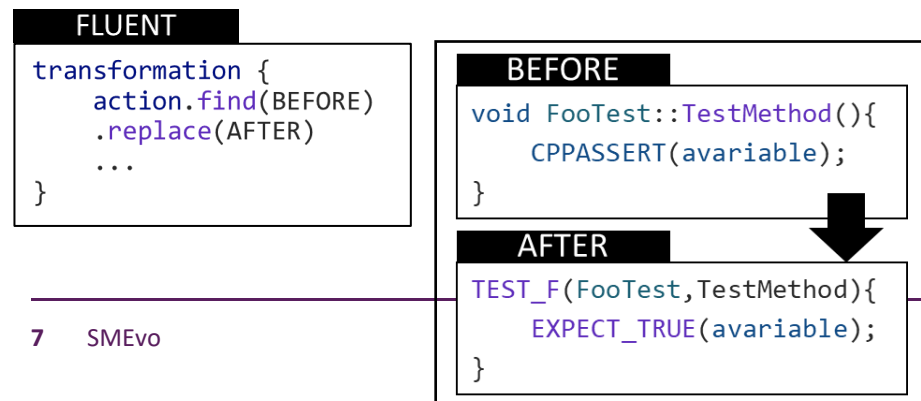

2 Extract

3 Analyse

4 Transform

EVOLVING PROGRAMMING LANGUAGES (1/2)

- Ada 2012 introduced quantified expressions

```
type Integer_Arr is
  array (Positive range <>) of Integer;

function Is_Zero (A : Integer_Arr)
  return Boolean is
  (for all I in A'Range => A (I) = 0);

function Has_Zero (A : Integer_Arr)
  return Boolean is
  (for some I in A'Range => A (I) = 0);
```

- In 2020, developers still wrote loops instead of using quantified expressions

```
function Is_Zero (A : Integer_Arr)
  return Boolean is
begin
  for I in A'Range loop
    if A (I) /= 0 then
      return False;
    end if;
  end loop;

  return True;
end Is_Zero;
```

```
function Has_Zero (A : Integer_Arr)
  return Boolean is
begin
  for I in A'Range loop
    if A (I) = 0 then
      return True;
    end if;
  end loop;

  return False;
end Has_Zero;
```

EVOLVING PROGRAMMING LANGUAGES (2/2)

- Not just a warning!
- Find & replace pattern
 - Simplify
 - not (\$var /= \$expr) → \$var = \$expr
 - ... is begin return \$expr; end ...; → ... is \$expr
- Educated developers
 - Usage of quantified expressions increased
 - More readable code due to higher abstraction
 - More idiomatic Ada

```
Rewriter_For_All_Range_Return :
  aliased constant Rewriter_Find_And_Replace :=
  Make_Rewriter_Find_And_Replace
    (Make_Pattern
      ("for $S_I in $S_Range " &
        "loop if $S_Cond then return false; end if; end loop; " &
        "return true;",
        Stmts_Rule),
    Make_Pattern
      ("return (for all $S_I in $S_Range => not ($S_Cond));",
        Return Stmt_Rule));
```

```
function Is_Zero (A : Integer_Arr)
  return Boolean is
begin
  for I in A'Range loop
    if A (I) /= 0 then
      return False;
    end if;
  end loop;

  return True;
end Is_Zero;
```

```
function Is_Zero (A : Integer_Arr)
  return Boolean is
  (for all I in A'Range => A (I) = 0);
```

HOW TO REALIZE A TRANSFORMATION?

- Complete transformation

C:\temp\diff\original.cpp	C:\temp\diff\final.cpp
1 #include <iostream>	1 #include <iostream>
2	2
- 3 void example(bool hasOldHardware)	+ 3 void example()
4 {	4 {
- 5 if (hasOldHardware) {	+ 5 std::cout << "Using New Hardware";
- 6 std::cout << "Using Old Hardware";	
- 7 } else {	
- 8 std::cout << "Using New Hardware";	
- 9 }	
10 }	6 }

- Hard for reviewer to see
 - What was the overall approach?
 - What was really required? What is unique for this transformation?
 - What are consequences, such as simplifications and changes in indentation? What is reused?

HOW TO REALIZE A TRANSFORMATION? IN STEPS!

Recipe

- Old hardware no longer available

- Simplification

- Correct indentation

C:\temp\diff\original.cpp	C:\temp\diff\minimal.cpp
<pre> 1 #include <iostream> 2 3 void example(bool hasOldHardware) 4 { 5 if (hasOldHardware) { 6 std::cout << "Using Old Hardware"; 7 } else { 8 std::cout << "Using New Hardware"; 9 } 10 } </pre>	<pre> 1 #include <iostream> 2 3 void example() 4 { 5 if (false) { 6 std::cout << "Using Old Hardware"; 7 } else { 8 std::cout << "Using New Hardware"; 9 } 10 } </pre>
C:\temp\diff\minimal.cpp	C:\temp\diff\intermediate.cpp
<pre> 1 #include <iostream> 2 3 void example() 4 { 5 if (false) { 6 std::cout << "Using Old Hardware"; 7 } else { 8 std::cout << "Using New Hardware"; 9 } 10 } </pre>	<pre> 1 #include <iostream> 2 3 void example() 4 { 5 6 7 8 9 10 </pre>
C:\temp\diff\intermediate.cpp	C:\temp\diff\final.cpp
<pre> 1 #include <iostream> 2 3 void example() 4 { 5 std::cout << "Using New Hardware"; 6 } </pre>	<pre> 1 #include <iostream> 2 3 void example() 4 { 5 std::cout << "Using New Hardware"; 6 } </pre>

LESSONS LEARNED

- Use recipes
 - Use basic rules – find, filter, and replace – separation of concern
 - Organize rules – repeat and sequence
- Support reviewer
 - Recipe, complete transformation, and the individual steps
 - Focus on the risky parts
- Enable reuse
 - Improves quality
 - Simplifications are typically needed
 - Filtering based on the variables read and written within code snippets

2

USE CASE @ ASML

TNO ESI

Powered by industry
and academia

SOFTWARE STACK @ ASML

- Two programming languages C and Python
- Multiple components
- Code
 - Well-structured
 - Readable and maintainable
- Two UI frameworks
 - Motif in C
 - Tkinter in Python

TRIGGER FOR USE CASE

Motif is deprecated

Chapter 9. Deprecated functionality

https://docs.redhat.com/en/documentation/red_hat_enterprise_linux/8/html/8.5_release_notes/deprecated_functionality

Red Hat Documentation AI Learn Documentation

Home > Products > Red Hat Enterprise Linux > 8 > 8.5 Release Notes > Chapter 9. Deprecated functionality

Red Hat Enterprise Linux

Filter table of contents

- Deprecated functionality
 - 9.1. Installer and image creation
 - 9.2. Software management
 - 9.3. Shells and command-line tools
 - 9.4. Security
 - 9.5. Networking
 - 9.6. Kernel
 - 9.7. File systems and storage
 - 9.8. High availability and clusters
 - 9.9. Compilers and development tools
 - 9.10. Identity Management
 - 9.11. Desktop
 - 9.12. Graphics infrastructures
 - 9.13. The web console

9.12. Graphics infrastructures

AGP graphics cards are no longer supported

Graphics cards using the Accelerated Graphics Port (AGP) bus are not supported in Red Hat Enterprise Linux 8. Use the graphics cards with PCI-Express bus as the recommended replacement.

(BZ#1569610)

Motif is deprecated

The Motif widget toolkit is now deprecated. Development in the upstream Motif community is inactive.

The following Motif packages are deprecated, including their development and debugging variants:

- motif
- motif-static
- openmotif
- openmotif21
- openmotif22

Red Hat recommends using the GTK toolkit as a replacement. GTK is more maintainable and provides new features compared to Motif.

(JIRA:RHELPLAN-98983)

CHOICES

- ASML maintains Motif themselves
- Migrate to another UI framework in C
 - GTK, recommended by Red Hat
 - Qt
 - ...

- Migrate to Tkinter UI framework in Python

transpilation

TRANSFORMATION VS TRANSPILATION

- When transforming code, source and target language are the same
 - Incremental way-of-working
 - Many steps – separation of concerns
-
- When transpiling code, source and target language differ
 - Impossible to parse intermediate result
i.e., partly in source and partly in target language
 - Single step – integrated effort

explainability

DESIRED SOLUTION

from
Motif in C
to
Tkinter in Python

The resulting code should be acceptable for the developers

readable & maintainable
explainable transformation

DESIRED SOLUTION

from
Motif in C
to
Tkinter in Python

Estimation for manual transpilation

100 man-years

TRANSPILATION

- Exploit structure in code
 - Business logic – not migrated
 - Call C function from Python
 - UI layout
 - Dedicated script written to convert resource file from Motif's FrameMaker to Tkinter format
 - UI logic from C to Python
 - Not performance critical
 - Not all C constructs used, e.g., no pointers
 - Some challenging C constructs used, e.g., macros

TRANSPILATION

- Exploit structure in code
 - Same organization
 - Folders
 - Files
 - Functions
 - Readability and maintainability
 - High level: Same structure
 - Low level: Idiomatic Python

RESEARCH QUESTION FOR USE CASE

Estimation for manual transpilation

100 man-years

Can automation reduce the effort?

LEARN BY EXAMPLE

TNO ESI
Powered by industry
and academia

LEARN BY EXAMPLE

C code

...

```
int a[N];
```

```
for (int i = 0; i < N; i++)
```

```
{
```

```
    a[i] = i * i;
```

```
}
```

...

LEARN BY EXAMPLE

C code

...

```
int a[N];
```

```
for (int i = 0; i < N; i++)
```

```
{
```

```
    a[i] = i * i;
```

```
}
```

...

Rule

```
$type $var[$size];
```

```
for (int $i = 0; $i < $size; $i++)
```

```
{
```

```
    $var[$i] = $expr;
```

```
}
```

→

```
$var = [$expr for $i in range($size)]
```

LEARN BY EXAMPLE

C code

...

```
int a[N];
```

```
for (int i = 0; i < N; i++)
```

```
{
```

```
  a[i] = i * i;
```

```
}
```

...

Rule

```
$type $var[$size];
```

```
for (int $i = 0; $i < $size; $i++)
```

```
{
```

```
  $var[$i] = $expr;
```

```
}
```

→

```
$var = [$expr for $i in range($size)]
```

LEARN BY EXAMPLE – PLACEHOLDER & RULES

C code of **\$expr**

Rule – Literal

i * i

\$lhs * \$rhs $\rightarrow$ **coverflow(\$lhs * \$rhs)**

Rule – Idiomatic

\$lhs * \$rhs $\rightarrow$ **\$lhs * \$rhs**

LEARN BY EXAMPLE

C code

```
...
int a[N];
for (int i = 0; i < N; i++)
{
    a[i] = i * i;
}
...
```

Rule

```
$type $var[$size];
for (int $i = 0; $i < $size; $i++)
{
    $var[$i] = $expr;
}
→
$var = [$expr for $i in range($size)]
```

Python literal code

```
...
a = [coverflow(i * i) for i in range(N)]
...
```

Python idiomatic code

```
...
a = [i * i for i in range(N)]
...
```

4

RENAISSANCE APPROACH FOR TRANSPILATION

TNO ESI

Powered by industry
and academia

REQUIREMENT: MAINTAINABLE CODE

- Determine whether C-language- and compiler-specific behaviour occurs
 - Transpile to non-idiomatic Python code that throws exception whenever specific behaviour occurs
- Test non-idiomatic Python code extensively
- No exception occurred → Transpile to idiomatic Python code
- Exception occurred → Determine best way forward
 - Adept C-code
 - Non-idiomatic transpilation to Python
 - Reimplement in Python
 - ...

REQUIREMENT: MAINTAINABLE CODE

- Ensure ASML can easily maintain generated Python code

$i++ \rightarrow (i, i := i + 1)[0]$

- Idiomatic Python instead of literal transpilation
 - Acceptable for both compiler / interpreter and human developers
 - Prevent that expertise in C, Python, and on the actual transpilation is needed to maintain the code
 - Is literal transpilation even possible for undefined behaviour?

$i + 1 > 0 \Leftrightarrow i \geq 0$

Does overflow occur for $i == \text{INT_MAX}$?

- Exploit regularities, conventions, and patterns in the original C code
- Keep particularities of the C-language out of the generated Python code
 - Keep functional behaviour and remove history of development
 - Awareness of C-language- and compiler-specific behaviour

REQUIREMENT: EFFICIENCY

- Count usage of C constructs and UI widgets
 - Frequently occurring → Automatic transpilation
 - Rarely occurring → Manual transpilation
 - Not occurring → No effort needed
- Clear interface: What must be done manually?
 - For both human / developers and computer / version control system

REQUIREMENT: EFFICIENCY

- Generate analysable code, also for the manual parts
 - In Python, use “pass” for statements and “None” for expressions
 - Use comments to specify what must be done
- Communicate what is exactly done
 - Remarks that help testers and reviewers

PRINCIPLE: PREPARE, TRANSPILE, FINALIZE

- From human readable, maintainable C code to C code prepared from transpilation to Python
- Transpilation
 - described using rewrite rules
 - based on AST
- Exploit existing tooling for Python as much as possible to simplify transpilation
 - Formatters, pretty printers, beautifiers, (expression) simplifiers, linters, ...

PRINCIPLE: PREPARE, TRANSPILE, FINALIZE

Increase regularity of code

- Standardize if statements

```
if (cond) return 0;
if (cond) { return 0; }
```

- Standardize for loops

```
for (i=0; i < 10; i++) { f(i); }
for (i=0; i < 10; ++i) { f(i); }
```

- Standardize if statements

```
if (cond) { return 0; }
if (cond) { return 0; }
```

- Standardize for loops

```
for (i=0; i < 10; i++) { f(i); }
for (i=0; i < 10; i++) { f(i); }
```

PRINCIPLE: PREPARE, TRANSPILE, FINALIZE

Increase regularity of code

- Separate declaration and initialization in C

```
int sqr[10];
int cube[20];
```

```
for (int i = 0; i < 10; i++) { sqr[i] = i*i; }
for (int i = 0; i < 20; i++) { cube[i] = i*i*i; }
```

- Desired idiomatic Python

```
sqr: list[int] = [ i*i for i in range(10) ]
cube: list[int] = [ i*i*i for i in range(20) ]
```

- Prepare for pattern matching

```
int sqr[10];
for (int i = 0; i < 10; i++) { sqr[i] = i*i; }
```

```
int cube[20];
for (int i = 0; i < 20; i++) { cube[i] = i*i*i; }
```

PRINCIPLE: PREPARE, TRANSPILE, FINALIZE

- Example of investigation
 - Precedence of operators differs between C and Python
 - Simplest solution – just add brackets everywhere and let tool remove the redundant ones
 - Unfortunately, no tool for Python exists that removes redundant brackets
 - So transpilation had to handle difference in precedence

PRINCIPLE: KEEP FUNCTIONAL BEHAVIOR

REJUVENATION METHODOLOGY

Analysis

Automation

Validation

REJUVENATION METHODOLOGY

Analysis

- Code base analysis
 - Frequency of
 - UI widgets
 - Language constructs
 - Patterns
- Languages analysis
 - Commonalities and differences
 - Contexts that expose differences

REJUVENATION METHODOLOGY

Automation

- Rules
 - Find and replace – sequence of AST nodes
 - Placeholders – single and multi
- Rule engine
 - Applies rules in given order
 - Recursive on placeholders
 - Catch all – manual action required
- Rule organization
 - Simplify handling different scenarios
 - Simplify iteration

REJUVENATION METHODOLOGY

Validation

- Transpilation rules – Unit tests
 - Compilable
 - Adhere to style
 - Correct
- Functional regression – End to end tests
 - Context of usage
 - Which differences can be ignored?
 - Correct transpilation
 - Equivalent traces on same test vectors

RENAISSANCE APPROACH: RULE ORGANIZATION

- Separate lists provides structure
- Enables different transpilation and our way-of-working

RENAISSANCE APPROACH: RULE ORGANIZATION

- Separate lists provides structure
- Enables different transpilation and our way-of-working

Z += X;

transpilation for testing

```
def except_overflow(value):  
    if not (-2**31 <= value < 2**31):  
        raise Exception("Integer overflow")  
    return value
```

`z = except_overflow(z + x)`

idiomatic transpilation

`z += x`

literal transpilation

```
def emulate_overflow(value):  
    return (value + 2**31) % 2**32 - 2**31
```

`z = emulate_overflow(z + x)`

ACTIVE WIDGET: LITERAL

```
int nrofWidgets = 8;

int toWidgetId(int id) {
    return (nrofWidgets + id) % nrofWidgets;
}

int next (int widgetId) {
    return toWidgetId(widgetId + 1);
}

int previous (int widgetId) {
    return toWidgetId(widgetId - 1);
}
```

```
def cmod(numerator, denominator):
    pmod = numerator % denominator
    if pmod == 0:
        return pmod
    elif numerator * denominator < 0:
        return pmod - denominator
    else:
        return pmod

def coverflow(value):
    return (value + 2**31) % 2**32 - 2**31

nrofWidgets = 8

def toWidgetId(id):
    return cmod((coverflow(nrofWidgets + id)),
                nrofWidgets)

def next(widgetId):
    return toWidgetId(coverflow(widgetId + 1))

def previous(widgetId):
    return toWidgetId(coverflow(widgetId - 1))
```

ACTIVE WIDGET: CONTEXT OF USAGE

```
int nrofWidgets = 8;

int toWidgetId(int id) {
    return (nrofWidgets + id) % nrofWidgets;
}

int next (int widgetId) {
    return toWidgetId(widgetId + 1);
}

int previous (int widgetId) {
    return toWidgetId(widgetId - 1);
}
```

```
def mod(numerator, denominator):
    if numerator < 0 or denominator < 0:
        raise Exception("Negative argument");
    return numerator % denominator

def overflow(value):
    if not (-2**31 <= value < 2**31):
        raise Exception("Integer overflow")
    return value

nrofWidgets = 8

def toWidgetId(id):
    return mod((overflow(nrofWidgets + id)),
              nrofWidgets)

def next(widgetId):
    return toWidgetId(overflow(widgetId + 1))

def previous(widgetId):
    return toWidgetId(overflow(widgetId - 1))
```

ACTIVE WIDGET: USING NATIVE OPERATORS

    return toWidgetId(widgetId + 1);
}

int previous (int widgetId) {
    return toWidgetId(widgetId - 1);
}
```

```
nrofWidgets = 8

def toWidgetId(id):
    return id % nrofWidgets

def next(widgetId):
    return toWidgetId(widgetId + 1)

def previous(widgetId):
    return toWidgetId(widgetId - 1)
```

5

RESULTS OF USE CASE

TNO ESI
Powered by industry
and academia

AREAS OF ATTENTION FOR TRANSPILATION

Areas of Attention	Examples	C	Python
difference in signatures of operators and functions	division (/) and & or operator	division: $\text{int} \times \text{int} \rightarrow \text{int}$ e.g., $1/5 \rightarrow 0$ and: $\text{int} \times \text{int} \rightarrow \text{bool}$ e.g., $1 \ \&\& \ 13 \rightarrow 1$	division: $\text{int} \times \text{int} \rightarrow \text{float}$ e.g., $1/5 \rightarrow 0.2$ and: $\text{int} \times \text{int} \rightarrow \text{int}$ e.g., $1 \text{ and } 13 \rightarrow 13$
difference in properties of operators	associativity, chainable, and evaluation (lazy/eager)	no chaining e.g., $-1 < 0 < 1 \rightarrow \text{False}$	chaining e.g., $-1 < 0 < 1 \rightarrow \text{True}$
difference in the relative precedence of operators	equality (==) and bit-wise and (&)	equality has precedence over bit-wise and $1 \ \& \ 3 == 1 \rightarrow \text{False}$	bit-wise and has precedence over equality $1 \ \& \ 3 == 1 \rightarrow \text{True}$
operators and functions whose behavior is “under discussion”	mod & div operator division (0/0) power (0^0)	same sign as dividend e.g., $-1 \% 3 \rightarrow -1$ $0 / 0 \rightarrow 0$	same sign as divisor e.g., $-1 \% 3 \rightarrow 2$ $0 / 0 \rightarrow \text{division by zero error}$
difference in data types	array int	array has no length information $2147483647 + 1 \rightarrow -2147483648$	array has length information $2147483647 + 1 \rightarrow 2147483648$
difference in invariants	range of data types modulo	$-2147483648 \leq i \rightarrow \text{True}$ $(N + i) \% N \neq i \% N$	$-2147483648 \leq i \rightarrow \text{dependent on } i$ $(N + i) \% N \Leftrightarrow i \% N$

BENEFIT OF RENAISSANCE APPROACH

- ASML selected two components to get insight in Renaissance approach and to estimate its benefits
- ASML supported TNO ESI to transpile components
- ASML estimated benefit of 70 %

6

COMPARISON

TNO ESI

Powered by industry
and academia

COMPARISON WITH AI (2024)

- Brief experiment
- AI did not handle any of the problematic areas we found correctly
- Similar effort — provide rewrite rules to AI
- Non-deterministic output — output still to be checked
- So, our methodology preferred over AI
- Whether that is still the case?

7

SUMMARY

TNO ESI

Powered by industry
and academia

SUMMARY USE CASE

- Not a C to Python transpiler
 - Only the ASML code base
 - Only the UI logic
- Effective use of automation
 - Automation must be worthwhile
 - Only frequently occurring patterns
 - Prepare, transpile, and finalize
- Estimation for manual transpilation
 - 100 man-years
- Can automation reduce the effort?
 - Estimation of 70% reduction
